The free oscillations of the World Ocean on the rotating Earth consist of gravity and vorticity modes, primarily governed by the gravity of the Earth and by the latitude dependent Coriolis force, respectively. A total of 284 free oscillations is found in the period range of 7.7 h to 165 h.

Of these, 169 oscillations are classified as physically relevant, while the remaining 115 are considered to be spurious modes.

A Large Spectrum of Free Oceanic Oscillations | Springer ... An ocean model has been developed to compute a large set of barotropic free oscillations with explicit consideration of dissipative terms and the full ocean loading and self-attraction effect. The Implicitly Restarted Arnoldi Method is utilized to determine these free oscillations. Synthesis of forced oscillations, Part I: Tidal dynamics ... Abstract. Free oscillations in the period range from 9 to 40 h and their corresponding adjoint solutions are used to synthesize semidiurnal and diurnal tides of second degree. The free oscillations are determined with explicit consideration of frictional terms and the full loading and self-attraction effect. A Large Spectrum of Free Oscillations of the World Ocean ... A Large Spectrum of Free Oscillations of the World Ocean Including the Full Ocean Loading and Self-attraction Effects PDF-ebook in english (with Adobe DRM) In this book, data from a model ocean developed to compute free oscillations is used to analyze the LSA effect on tides and the synthesis of tides by free oscillation.

A Large Portion Of The Spectrum

A Large Spectrum of Free Oscillations of the World Ocean ... The ocean tides are the most prominent forced oscillations in the global ocean. Recent research showed that tides play an important role for the earth's climate system and they are of considerable interest for the post-processing of satellite data. The free oscillations of the world ocean in the period ... It is shown that the spectrum of eigen oscillations of the world ocean incorporates a mode with a period of about 100 h. It results from narrow straits connecting separate oceanic basins.
